NATIVE PLANTS

Growing and Caring for Roses

Planting

Location: Plant in an area that receives full sun (at least 6 hours); preferably morning sun. Roses need very good drainage, so plant in a raised bed, about 6 to 12 inches above the ground.

Soil: Build beds with a good rose mix such as Gardenville Rose Soil, or mix your own by using 1/3 potting soil, 1/3 sand, and 1/3 compost. It's a good idea to prepare the bed a week or two before you plant.

Spacing: Know the mature size of the variety you are planting and place your roses with enough space to avoid crowding later. Good air circulation is a must.

Planting: Dig a hole twice as wide as the container and deep enough so that the bud union is 2" above the ground. Put a handful of bone meal at the bottom of the hole, and mix some in with the planting soil - this will encourage strong root growth. Fill in the soil around the root ball and water it down.

Watering

Water your roses regularly, keeping soil evenly moist but not overwatering. They need at least 2 inches of water a week. Avoid watering late in the day - the earlier the better. **Do not** water the leaves! Water the soil only. Moisture on the leaves provides the perfect conditions for black spot and other fungus & disease.

Mulching

Cover your rose beds with 2-3 inches of shredded bark mulch. This will protect the roots from extreme temperatures, retain moisture, and help prevent weeds.

Fertilizing

Do not fertilize your roses right after you plant them - this will burn the roots you are trying to establish. Wait until after the first bloom cycle. Fertilize monthly from March to August with a good organic fertilizer like Rose-Glo. Don't fertilize after September 15 - this will push new growth that can be damaged by cold.

To apply fertilizer, rake mulch back to the dripline, then evenly spread the fertilizer over the exposed soil. Push the mulch back over the area, then water the bed well.

Cleaning

Clean your roses on a regular basis by deadheading spent blooms and removing dead or diseased leaves before they fall to the ground. If left underneath the bush, this debris creates a breeding ground for pests and disease. When cutting spent blooms, cut the cane at a 45 degree angle at the juncture of an outwardly facing 5-leaf leaflet, as this is where a new cane will come from.

Pruning

Antique Roses: Hard pruning is never necessary, but you may wish to lightly prune for shape, and it is also a good idea to cut canes that are crossing or growing into the center of the bush. If you do, prune after a bloom cycle and don't cut back more than a third of the bush.

Modern Roses: Prune them on or around Valentine's Day. First, cut any dead or diseased canes. Second, cut away crossing canes. Third, cut canes that are smaller than pencil size. Finally, pick the best 4-5 canes in a vase shape and cut the rest of the canes away. Remember to cut canes all the way back and don't leave stubs at the base of the plant.

Pest & Disease Prevention

If you follow the instructions above - proper location, keeping water off leaves, using mulch, feeding regularly, clearing away debris - you are much less likely to encounter these problems.

To further prevent them, use an organic soil amendment like SoilSoup compost tea. It is brewed fresh here at Buchanan's, which creates a huge population of beneficial microbes that activate nutrients in your soil, rejuvenating it. Using SoilSoup on your roses will strengthen them against insects and disease. If you do have a problem that gets out of hand, we have good organic fungicides & insecticides like Rose Defense.

If you need help with diagnosis, feel free to bring in a cutting of your rose (in a sealed bag, please) and we'll help you find the best solution.

We're always here to answer any other questions you have about roses. Feel free to visit or call us with any of your concerns. Happy growing!
